

## **Critic Time on Usage Non Renewable Energy and Urgency of Renewable Energy Sources**

There seem still preventable measures taken urgently despite of energy crisis increase so swiftly around the world. It should be no 'polemics' no if's or any but sound the inevitability regarded Renewable Energy and its sources. When there are simple answers to our complicated questions from the point of the availability natural replaceable energy, what is to point to enigmatic argumentations? For example, solar panels, wind power, hydro electrical plant and so more. Non renewable energy sources proof that they are not sufficient but they are create economical war, air pollution, noise pollution. They take more than what they can give. Wind powered, solar powered energy sources have already been implemented, in used in Europe and different part of the world as oppose what has been proposed they are economical. They are feasible. They are viable. They are fact. They are ready to use. I think as Renewable Energy Society newsletter suppose there are plenty projects to achieve renewable energy types wind power uses the force of the wind to drive a turbine that produce electricity. It is the fastest growing segment of global energy market. Wind generated electricity feasibility has dramatically increased in recent years due to numerous grants, rebates and incentives through state and federal programs, enhancing their feasibility and return on investment to provide renewable energy to residential and commercial clients.
